

HOLD RELEASE UNTIL 17/10/2018

TeslaStarter is Ready to Start Funding Free Energy Projects!

TeslaStarter, the crowdfunding platform developed by Teslacoins team is focused on funding 'Free Energy' projects, it has finally been launched and is ready to start receiving 'Free Energy' project propositions. The objective of the platform is to accelerate the transition to a sustainable energy system by funding the research and development of independent inventors.

Teslacoins is the cryptocurrency based on the new blockchain technology birthed as an ode to the often forgotten genius Nikola Tesla. The only objective of the currency born 4 years ago is to help the Free Energy inventors and to achieve that goal they have created TeslaStarter.

“TeslaStarter will go through different phases the first one being crowdfunding worthwhile research”, said Matt from Teslacoins team. Since the project is in an embryonic state they expect to receive thousands of projects that will be reviewed by Teslacoins team, and the committee that will be composed of Free Energy experts.

“Once the research starts moving forward in big steps and we start seeing working prototypes of products that clearly reduce the cost of producing energy, we do expect to start receiving propositions from teams willing to raise money to start producing the new product in mass scale” commented Rw from the team.

It's time to make the world a better place. It's time that the 4 billion people still without access to electricity still using fuels like wood, charcoal, coal and dung for cooking and heating have access to a cleaner and more effective energy source. It's time for an environmental clean source of energy. It's time for a breakthrough in the energy field. It's time for Free Energy.
